

Disposition policy consistency

This is a policy-consistency analysis, not an independently human-labeled disposition accuracy measurement.

Disposition was not independently human-labeled in the frozen evaluation, so end-to-end disposition accuracy cannot be claimed. The agreed human identity, completeness, and Amazon condition for each of the 40 cases were passed into the existing `policy_v1`. That output is compared with the disposition already saved on the frozen grade. The model was not rerun. `policy_v1` was not changed. The labels and the frozen results were not changed.

Upstream visual classification errors remain separate from policy behavior. A mismatch is upstream when the human checks and the saved agent checks differ. A true policy mapping inconsistency would mean the same normalized check results produce different dispositions.

Comparable cases	40
Policy-consistent dispositions	27/40
Policy consistency rate	67.5%
Mismatches	13
True policy mapping inconsistencies	0

The excluded disagreements are RTN-002, RTN-005, RTN-006, RTN-009, RTN-013, RTN-037, and RTN-044. RTN-017, RTN-026, and RTN-032 are excluded because they have no model grade.

40/40 saved agent dispositions were reproduced exactly by `policy_v1` from the agent's saved checks; there were zero true policy-mapping inconsistencies.

27/40 (67.5%) is not disposition accuracy. It is only agreement between `policy_v1` applied to the agreed human checks and the saved agent dispositions. Every mismatch below is an upstream perception mismatch.
